Retirement planner

Congratulations on completing your Retirement planner.

This report is generated from Moneysmart's retirement planner based on the information you entered and the assumptions outlined in this document.

It provides you with an illustration of your modelled retirement income compared to your retirement income target.

Your modelled retirement income

$610,389
Estimated balance at retirement

$0
Retirement income target

$51,335
Average estimated income

$51,335
Average income above target

Outlined below are the changes you modelled to your contributions and investment strategy, with a full list of inputs and modelling assumptions overleaf:

Modelled changes to your contributions and investment strategy

Contributions	Current strategy	Revised strategy
Before tax (salary sacrifice)	$0 per month	$0 per month
After tax	$0 per month	$0 per month

Investment strategy	Current strategy	Revised strategy
Before retirement	Balanced	Balanced

About you

	You
Age	66
Gender	Prefer not to say
Salary	$0
Retirement age	67
Age for super to last	92

Your retirement goals

Regular income in retirement	$0 per year

Super savings

	You
Current balance	$600,000
Investment choice (before retirement)	Balanced
Investment choice (after retirement)	Conservative
Employer contribution	$0 per month
Before tax (salary sacrifice)	$0 per month
After-tax	$0 per month

Other assets and income to fund retirement

Shares or managed funds (today's value)	$0
Cash in savings account (today's value)	$0
Investment property (today's value)	$0
Net rental yield	2%

Administration fees

Superannuation Account	You
Administration fees (p.a)	$59
Administration fee (% of balance p.a)	0.11%
Administration fee cap (p.a)	$710
Insurance premiums (p.a.)	$599
Adviser service fee	$0
One-off advice cost	$0

Pension Account	You
Administration fees (p.a)	$69
Administration fee (% of balance p.a)	0.14%
Administration fee cap (p.a)	$900
Adviser service fee	$0
One-off advice cost	$0

Age pension

Include age pension	Yes
Will you own your own home	Yes
Personal assets	$0

Inflation assumptions

Inflation rate	2.5%
Wage inflation	3.7%
Deflator (before retirement)	3.7%
Deflator (after retirement)	2.5%

Salary growth	
Your salary growth	0%

Investment return assumptions

Investment Risk Level	Superannuation Account Returns per annum (net of investment related fees, costs and tax)	Pension Account returns per annum (net of investment related fees and costs)
High Growth	6.8%	7.2%
Growth	6.4%	6.9%
Balanced	6.1%	6.7%
Moderate	5.7%	6.3%
Conservative	4.9%	5.6%
Cash	3.7%	4.3%
Other	6.1%	5.6%

Investment type	Assumed investment return per annum
Cash	4.3%
Shares / Managed funds	7%
Investment property capital growth	3.7%

Important information you need to know

This is an estimate, not a prediction.

The results from this calculator are based on the limited information that you have provided and assumptions made about the future. The amounts projected are estimates only and are not guaranteed.

This calculator cannot predict your final superannuation benefit or level of retirement income with certainty because this will depend on your personal circumstances, unexpected life events, the Age Pension paid, investment earnings, tax and inflation.

This calculator assumes that your contributions are steady and predictable and that all assumptions remain steady. These assumptions are essential so the calculator can show the effect of things you may be able to control, such as choosing a different investment option.

Consider updating the projections provided by this model regularly, particularly if your circumstances have changed.

Some of the assumptions can be changed to reflect your personal circumstances.

Do not rely solely on this calculator to make decisions about your retirement. There may be other factors to take into account. Consider your own needs, financial situation and investment objectives. You may wish to contact the Financial Information Service or get advice from a licensed financial adviser.

Results are shown in today's dollar value

The figures shown in this tool are in today's dollars, which means they've been adjusted to remove the effect of inflation over time. This helps you understand what your future income or savings might be worth in terms you're familiar with today. For example, if the tool estimates that you'll need $50,000 per year in retirement, that means you'll need the same buying power as $50,000 would give you now — not in inflated future dollars.

Inflation means that the cost of living gradually increases. Take a loaf of bread: 20 years ago, it might have cost around $2. Today, it's closer to $4. If inflation continues at a similar pace, that same loaf could cost $8 or more in another 20 years. By showing your results in today's dollars, we make it easier to understand what your retirement income would actually afford in terms of real, everyday expenses — like groceries, bills, and other essentials — based on today's cost of living.

This adjustment is called the "deflator", and the default assumption for this adjustment before retirement is consistent with the default rate for Wage Inflation, while the default for this adjustment after retirement is consistent with the default assumption for Inflation Rate. You can adjust both of these assumptions in the Settings screen.

Settings you can change - default assumptions and limitations

You can change the default assumptions set out under 'Settings'. The most recent figures used in these calculations are from September 2026.

Any input you make will be assumed to apply for the whole of the calculation period unless stated otherwise. You should be aware that what actually eventuates is likely to be different from what is assumed and that even small changes to assumptions can make large differences in the results.

Government Age Pension

By default, the calculator assumes you are eligible for a Government Age Pension and includes your estimated entitlement each year in your retirement income projection. This is considered reasonable because the vast majority of Australians become eligible for this benefit and it helps to illustrate the potential of Government Age Pension income supplementing income from your superannuation in retirement.

Using the settings and assumptions, you can choose to exclude a Government Age Pension in the calculation of your retirement income.

If you choose not to exclude it or accept the default of including it, this calculator will produce an estimate based on the Services Australia income and assets tests, our assumptions, and the information you provide. Specific information includes:

- The calculator applies the relevant Services Australia income and assets tests according to the couple status and home ownership status you select in the calculator.
- As a default, the calculator assumes you will own your home in retirement and have $25,000 of personal assets (car, furniture, etc.), no investment assets (including no investment property), and no other income. This is considered reasonable as ABS data shows more than 50% of Australians own their own home. Additionally, $25,000 for contents is reasonable due to Social Security assessing all personal household contents at $10,000 unless stated otherwise and second-hand car value at $15,000. You can indicate you will not own your home using the Settings screen and/or input figures relating to your assets as totals.
- Unless you enter details regarding your spouse and their financial circumstances, the calculator will by default assume that you are single for the purpose of determining Government Age Pension entitlements.
- To calculate an estimate of Government Age Pension to include in your retirement income (and that of your spouse where applicable), the calculator takes into account:
    - in applying the assets test, the information you input about the value of personal assets, shares or managed funds, cash accounts, investment properties, superannuation accounts, and account-based pension accounts.
    - in applying the income test, the investment income deemed to be earned on superannuation accounts, account-based pension accounts, shares and managed funds, and cash accounts (excluding investment properties) based on deeming rules, plus any other income you enter and the projected net rental amount based on the net rental yield you enter for any investment property.

Please note, the assets test and income test estimates may vary from your actual position when Services Australia applies them because Services Australia applies a more detailed calculation. Your personal circumstances may exclude you from eligibility for a Government Age Pension and this may result in a variance from your actual outcome compared to the calculator illustration.

Financial Assumptions

Inflation and Wage Growth

The calculator uses various inflation and wage growth assumptions in the projections of your retirement income. These assumptions are considered reasonable because they reflect inflation and wage growth assumptions prescribed by law.

Inflation rate is set to 2.5% per annum by default and is used to inflate the following legislative factors over the period of the projection:

- Government Age Pension assets test threshold
- Government Age Pension income test threshold
- Deemed income asset threshold
- Transfer Balance Cap (increases only applied in $100,000 increments)

Wage inflation is set to 3.7% per annum by default and is used to inflate the following variables over the period of the projection:

- The value of your personal assets, investment property value, and other income
- Dollar based administration fees and advisor fees
- Insurance fees
- Administration fee caps
- Government Age Pension payment rate
- Concessional contribution caps (increases only applied in $2,500 increments)
- Non-concessional contribution caps (increases only applied in $10,000 increments)
- Government co-contribution salary thresholds

Your Salary growth and, where applicable, *Your Spouse's Salary growth* are set to 3.7% per annum by default and are used to inflate the following variables over the period of the projection:

- Your and your spouse's salary
- Your and your spouse's contributions to super

Your retirement spending goals including both regular income needs and lifestyle goals are inflated over time in the projection in line with the today's dollar adjustment / deflator assumptions.

Investment returns

The default assumption is 6.1% p.a. for superannuation account returns and 5.6% p.a. for pension account returns based on a Balanced investment portfolio in the accumulation phase and a Conservative investment portfolio in the retirement phase, but you can explore alternative investment risk levels (with a default return) in the calculator for both your and, if applicable, your spouse's superannuation and pension accounts.

The following table provides some details about the default investment return assumptions used by the calculator for each investment risk level.

Whilst the calculator is intended to be product agnostic, the expected returns illustrated below have been based on representative strategic asset allocations for the following range of investment options : 'Cash', 'Conservative', 'Moderate', 'Balanced', 'Growth' or 'High Growth'. The default investment return assumptions for each risk level do not necessarily reflect the way in which your superannuation is currently invested.

The table below illustrates the default investment return assumptions for each Investment risk level you can model in the calculator and the rates used:

Investment Risk Level	**Superannuation Account Returns per annum (net of investment related fees, costs and tax)**	**Pension Account returns per annum (net of investment related fees and costs)**
Cash	3.7%	4.3%
Conservative	4.9%	5.6%
Moderate	5.7%	6.3%
Balanced	6.1%	6.7%
Growth	6.4%	6.9%
High Growth	6.8%	7.2%

The calculator also allows you to model other investment assets, specifically investments held outside of superannuation as either Cash, Shares/Managed funds and Investment property. The calculator does not explicitly allow for any associated taxes on these income or capital gains attributable to these assets and it is assumed that any applicable fees and costs will be reflected in the assumed returns or paid from your non-superannuation cash/income (non-superannuation resources) and that any taxes will also be paid from your non-superannuation resources if and when they fall due. If desired, the cost of additional investment related taxes in retirement can be included in the projections using the lifestyle goals input.

Investment type	Assumed investment return per annum
Cash	4.3%
Shares / Managed funds	7.0%
Investment property capital growth	3.7%
Investment property net rental yield	2.0%

- The above assumptions are considered reasonable as they are based on actuarial advice provided to ASIC.
- Actual returns may vary significantly from year to year and could be negative in some years, particularly for investment allocations to growth assets, such as shares and property.
- You can vary the default investment return assumption applicable to your chosen risk level in the 'Settings' section of the calculator to see how higher or lower average returns affect the projection. The investment return assumed in the calculation, based on your inputs or the default for your chosen risk level, is not a guaranteed rate of return you (or your spouse where applicable) will receive on your (or your spouse's) superannuation investment.
- The investment option(s) in which your superannuation is currently invested (or which may be available to you) will have a risk level attributed to it which may or may not correspond with the risk levels shown above. The investment return assumptions for each investment risk level shown above should not be taken as a guide for the expected return for any investment option you are invested in, or may choose, for your superannuation account. If you would like assistance with modelling the impact of different returns on your projected income taking into account your current or a proposed superannuation portfolio, you should speak to a financial planner.
- Past performance is not a reliable indicator of future performance because actual returns may vary significantly from year to year and could be negative in some years, particularly for investment allocations to growth assets, such as shares and property.

Fees and costs

Administration Fees and Costs

The calculator assumes the following administration fees and costs (Administration fees) apply to the calculation of your superannuation and pension accounts. The Administration fees used by the calculator can be changed in the ‘Settings’ page to suit your circumstances.

	Superannuation Account	Pension Account
Administration fees ($ per annum)	$59	$69
Administration fees (% of balance per annum)	0.11%	0.14%
Administration fee cap	$710 per annum	$900 per annum

The calculator allows you to input an Administration fee cap, to model limits that may apply to administration fees that are charged to a member depending on the size of their account balance. For example, the percentage based administration fee may be capped.

Insurance premiums

The calculator assumes a default annual insurance premium amount of $599. The calculator allows you to input insurance premiums (per annum) for insurance cover you hold (or may hold) in your superannuation account. Insurance premiums usually apply for death, total and permanent disablement and income protection (or salary continuance) cover held through a superannuation account. Insurance premiums can vary significantly based on your circumstances and needs, consequently the calculator allows users to input an amount (in the Settings page) between a range of $0 and a maximum of $10,000 per annum. Insurance premiums are only applied in the calculation up to the earlier of age 65 or the retirement age and are not applied in the retirement phase.

Contributions

Employer contributions

The calculator assumes that your employer contributes the default Superannuation Guarantee (SG) rate, or the Employer Super contribution rate you input, as a percentage of your salary (based on statutory requirements). Refer to the Australian Taxation Office (ATO) website for details. Future contribution levels will depend on uncertain factors such as salary levels, rate of salary growth and time out of the workforce for any reason. While the calculator makes some default assumptions about contributions, contribution levels are not guaranteed.

The annual income used for employer contributions is not limited to the maximum super contribution base. If your employer does limit SG contributions to the maximum super contribution base, then your actual outcomes may be different to the results of the projection.

Before tax contributions (including salary sacrifice)

The calculator limits before tax contributions in each financial year, including the salary sacrifice contributions you input, so you do not exceed the concessional contributions cap (which applies to the total of your employer contributions including salary sacrifice contributions and other before tax contributions such as tax deductible personal contributions). Please refer to the ATO website at https://www.ato.gov.au/ for details on the current concessional contributions cap. This assumption is considered reasonable as many employers will limit their contributions to the concessional contributions cap, but if your employer does not do this, then your actual outcomes may be different to the results of the projection, depending on the actual amount of your before-tax contributions in the projection period.

The calculator will not allow you to input additional regular before tax contributions greater than your salary or the concessional contributions cap, but you can enter non-concessional (after tax) contributions.

After tax contributions

The calculator will not allow you to input additional regular after tax contributions greater than your salary or the non-concessional contributions cap. Please refer to the ATO website at https://www.ato.gov.au/ for details on the current non-concessional contributions cap. The calculator assumes the non-concessional contributions cap will continue to be set at four times the concessional cap and hence will increase at the same time as the concessional contributions cap in future years. Should your projected total superannuation balance exceed the projected Transfer Balance Cap (see below) at any year in the projection, the calculator limits your projected non-concessional contributions to zero for that year.

Government co-contribution

The calculator assumes that you are eligible for the government co-contribution if you make after-tax contributions, including that your income is below the relevant government threshold, and that you are under age 71 at the end of the financial year in which you make the after-tax contributions. Eligibility for the government co-contribution is also subject to minimum working requirements and the calculator assumes that you meet these too. This is considered a reasonable assumption because most Australians who make after-tax contributions, satisfy the above criteria and are eligible to receive a government co-contribution.

The total income used by the calculator to estimate if you qualify for any co-contribution is equal to your annual salary before tax and before any salary sacrifice. Any income from other sources and other available adjustments that are not input into the calculator may not be included in an estimate of total income. For the full definition of 'income' used by the ATO and other details on government co-contribution rules and limits, refer to the ATO website at https://www.ato.gov.au/.

If you do not in fact meet the criteria required for eligibility, this may result in the calculator using a different tax position to your actual tax position. Please note that should you not qualify for the government co-contribution, this would be one change which would make the projection differ from your actual outcome.

Low-income superannuation tax offset

The calculator assumes that you are eligible for a government low-income superannuation tax offset (LISTO) if you or your employer make before tax contributions for you, and your income is below the relevant government threshold. Eligibility for LISTO is also subject to age restrictions and minimum working requirements. This is considered reasonable as most Australians who satisfy these criteria would be eligible to receive a LISTO.

The total income used by the calculator to estimate if you qualify for a LISTO is equal to your salary before tax and before any salary sacrifice. For the full definition of 'income' used by the ATO and other details on LISTO rules and limits, refer to the ATO website at https://www.ato.gov.au/.

If you do not in fact meet the criteria for eligibility, this may result in the calculator using a different tax position to your actual tax position. Please note that should you not qualify for the LISTO, this would be one change which would make the projection differ from your actual outcome.

Refer to the tax section below for further information about the exclusion of other personal taxation circumstances that may be relevant to you.

Other assumptions

Transfer balance cap

The Transfer Balance Cap is a cap on the amount of superannuation eligible to be transferred to account-based pensions or other complying superannuation pensions in retirement (i.e. 'retirement phase' pensions). Please refer to the ATO website at https://www.ato.gov.au/ for details on the current Transfer Balance Cap. This calculator assumes you have not previously set up an account-based pension or other superannuation pension (e.g. lifetime pension) that is considered to be a 'retirement-phase' pension (Note: 'transition to retirement' pensions are not retirement-phase pensions). If you have previously set up a retirement-phase pension, this may have a material impact on your Transfer Balance Cap, and your circumstances may vary from the projection provided.

We recommend you speak with a financial planner if you have specific Transfer Balance Cap circumstances you wish to discuss. Similarly, the Transfer Balance Cap can be subject to change by the government in future periods and this may have a material impact on your actual outcome compared to the projected retirement income calculated by the calculator. As balances at retirement in excess of the projected Transfer Balance Cap are assumed to remain in a superannuation account similar to the one you held before retirement, the calculator assumes the same fees, costs and returns applied before retirement will be applied to this superannuation account (if applicable) after retirement.

Including your spouse

Including your spouse (if any) will allow a better estimate of the Government Age Pension to be provided to you as a couple and, as a result, a better estimate of the future drawdowns that you and your spouse (if any) need to make from super to meet your overall retirement income needs. Please note that it is a limitation of the calculator that it does not consider the transitional retirement income needs for couples that retire at different points in time. The desired retirement income goals are related only to the period from the default retirement age (67) or otherwise nominated retirement age.

Life expectancy

Life expectancy refers to the average number of additional years a person of a given age and sex could be expected to live, assuming current age-sex specific death rates are experienced throughout their lifetime. The life expectancy estimates shown in the calculator are based on population mortality as shown in Australian Life Tables 2020-2022 published by the Australian Government Actuary in December 2024 allowing for the improvement rates in longevity over the past 25 years continuing in the future as set out in those tables.

Drawdowns in retirement

After allowing for any Government Age Pension, investment property income or other income you are projected to receive in retirement, the calculator determines the drawdowns from your (and your partner's) pension account (and superannuation account if applicable in retirement), Shares and Managed funds and Cash account required to achieve the desired target income in retirement for the period to your nominated super run out age (default of 92 based on regulatory requirements).

The calculator assumes that you and your spouse (if any) drawdown your respective accounts/investments in proportion to your respective balance, subject to minimum drawdown requirements. This means if your super balance is above the Transfer Balance Cap, your desired target income will be subject to the minimum drawdown requirement, and thereafter the calculator will draw from your pension and accumulation accounts on a proportionate basis. The calculator applies the minimum drawdown rules annually to your drawdowns from your account-based pension which may result in a higher income being paid to you in some years. It does not take into account any tax that may be payable on income received from superannuation before age 60 or capital gains tax that may be applicable on any drawdowns from other investments.

Tax

It is assumed (based on what usually occurs) that you or your employer have provided your tax file number (TFN) to your superannuation fund and that, consequently the usual concessional tax rate of up to 15% tax is deducted from employer contributions (including salary sacrifice contributions) and other before-tax contributions.

As most people do not incur additional tax, the calculator assumes that any other taxes are paid by you outside your superannuation account, including (if applicable):

- Excess Concessional Contribution tax
- Excess Non-Concessional Contribution tax
- Division 293 tax (payable by higher income earners)

No income tax has been applied to estimated retirement income in the results of the calculator. Retirement income from superannuation is tax-free on or after age 60 however tax is likely to apply non-superannuation income (with the rate of tax depending on your individual circumstances).

The tax assumptions used are general in nature only and do not constitute tax advice. While some taxation consequences relating to superannuation are reflected in the calculations, the calculator does not incorporate all potential personal taxation circumstances. Please see your tax adviser for advice that is specific to your individual circumstances.

Calculator limitations

The calculator does not guarantee any financial outcomes and there are limitations applicable to any projection (given the nature of this calculator including the use of assumptions, and the potential impact of your personal, variable, circumstances) which may impact the estimate of your superannuation balance or retirement income.

Limitations include:

- This calculator is not appropriate for members who are already retired and drawing an account based or other retirement-phase pension.
- This calculator is not appropriate for anyone with a Defined Benefit interest. It does not project Defined Benefit entitlements.
- This calculator is not appropriate for users who wish to project the future value of their individual direct investments such as direct shares on the ASX.
- This calculator is not appropriate for users interested in projecting out their Transition to Retirement (TTR) income strategy.
- The illustration provided by the calculator takes into account certain information you input, however it does not consider all your personal circumstances including your current lifestyle expenses, other financial commitments such as debt, or other financial circumstances or needs and objectives (including insurance needs), which should be taken into consideration when obtaining personal financial advice.
- Superannuation and tax laws are subject to change. The calculator reflects laws applicable at a particular date and is not able to take into account different taxation and other legal conditions that may apply in future. While reasonable endeavours will be made to update the calculator regularly and in response to new legislation, it's possible future or pending (known) changes may not be captured at the time an estimate is provided.
- This calculator does not consider changes to spending patterns in retirement aside from the period lifestyle goals entered.
- This calculator does not consider the sale of investment property or other non-superannuation assets to fund retirement that might otherwise delay the need to draw down super.
- This calculator does not consider the impact of any inheritance or other injection of funds or contributions in the future that are not inputted into the calculator.
- This calculator is not designed to provide advice on whether savings should be used to reduce any debt you have as opposed to increasing your retirement income.
- The calculator does not allow for circumstances where a member has a previously established an account-based pension or other complying retirement-phase pension (e.g. a lifetime pension).
- The calculator provides a simplified age pension estimate, that may vary from your actual position when Services Australia applies the income and assets tests.
- This calculator does not consider the transitional retirement income needs for couples that retire at different points in time.

The calculator is not intended to be relied on for the purpose of making a decision in relation to a specific financial product and you should consider obtaining advice from a financial adviser before making any financial decisions.

If your circumstances change (for example, your insurance cover, employment, assets) you should use the calculator to update your projected retirement outcomes. Alternatively, you should review your position on at least an annual basis to cater for any changes that may have occurred in your personal situation.

Suitable devices

The calculator is able to be accessed on both desktop and mobile devices and is best viewed on a desktop computer. If using a device older than 4 years, then the features or functionality of the tool may be limited. Similarly, mobile devices with small screens may result in a sub-optimal user experience. The software used to access the calculator may also impact user experience. Typically, browsers older than 1 version behind the current one may not be able to access the calculator.

Applicable law

The calculator uses relevant laws current as at September 2026 and is subject to change as relevant laws change.
